

Introduction to the Eclipse Advanced Visualization Project

Robert Smith,
Scientific Software
Development Team,
Oak Ridge National
Laboratory

Outline

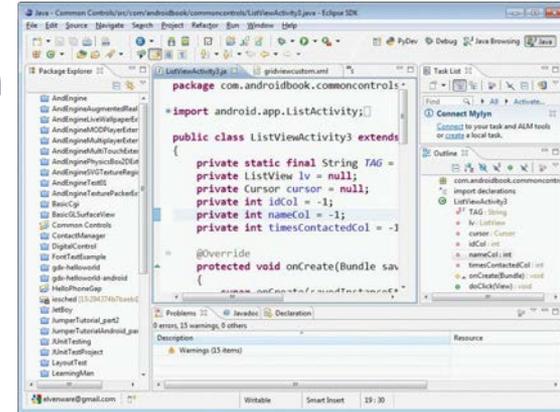

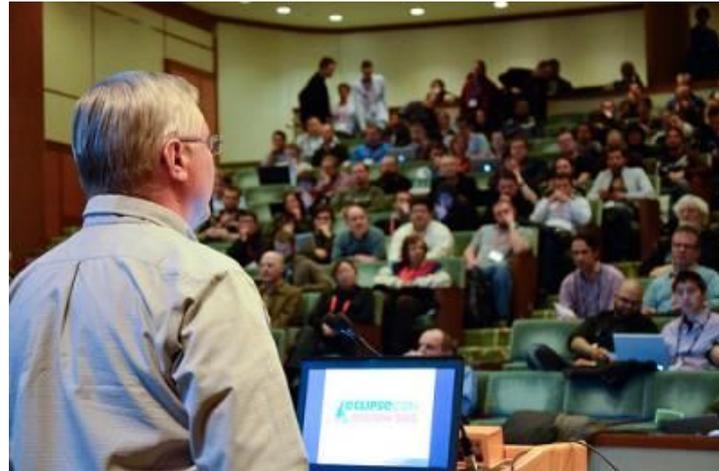

- Introduction to Eclipse
- Motivations for scientific visualization in Eclipse.
- Example visualization services
 - Graph plotting
 - VisIt and ParaView
 - Geometry and Mesh editing with JavaFX
- Setting up remote connections
- Future Developments

What is Eclipse?

- An Integrated Development Environment(IDE).

- A foundation.  eclipse

- A community.

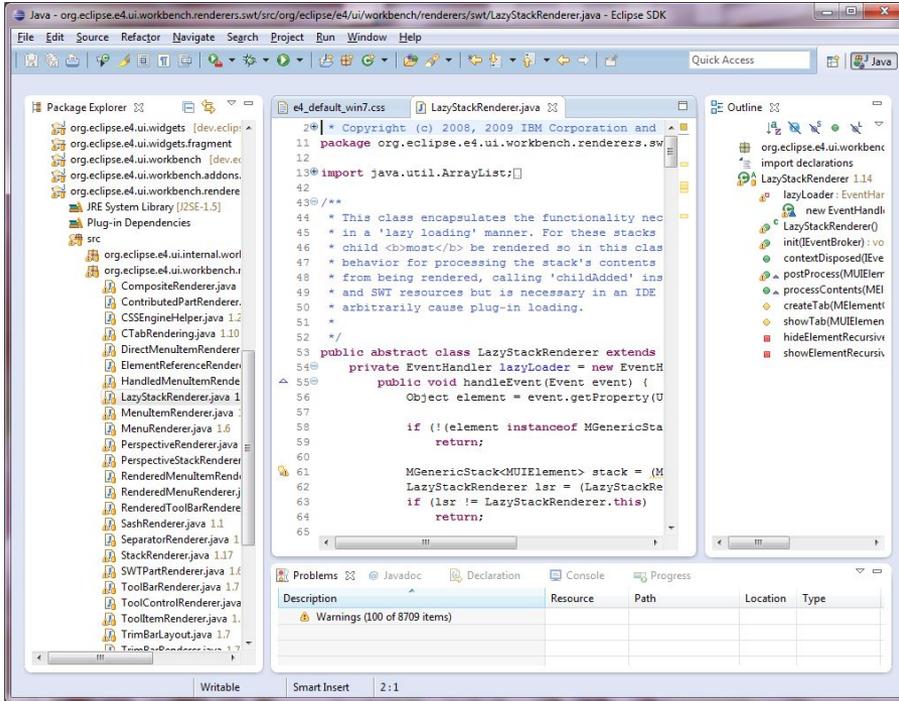

- A place for Research Software Engineers

What is the Eclipse Foundation?

- Managed by the Eclipse foundation.
- Not-for-profit corporation that maintains the Eclipse ecosystem
- Members include ORNL and other industry leaders like IBM, Oracle, and Red Hat
- Projects are official initiatives of open source development to benefit the community.
- Working Groups collaborate on focused development.

What is the Eclipse Workbench?

Java source code being edited in the Eclipse workbench.

- Uses the Open Service Gateway Initiative(OSGi) to manage the modular packages that make up the application.
- Provides the Rich Client Platform(RCP) as a way to extend the workbench to create custom apps by writing new OSGi plugins.
- Open source.
- Written in Java.

Motivation

Motivation for Integrating Visualization into a Workbench

- Simulation workflows span from writing code to visualizing results.
- Having a single RCP app which centralizes and simplifies all these actions would provide a useful tool for scientists.
 - Provides a convenient place for performing all parts of the workflow
 - Allows for use case specific knowledge to aid in workflow design (for e.g. error checking).

Motivation for Integrating Visualization into a Workbench

- ...But other, non-traditional use cases exist for which the ability to visualize files would be useful.
- The **Eclipse Advanced Visualization Project (EAVP)** was created to provide a framework of visualization resources for diverse RCPs.
- It has been evaluated by:
 - Marintek for creating oceanographic geometry.
 - Bosch evaluated it for use in visualization of automobile parts.
 - As well as Diamond, Itema, and Airbus

EAVP Overview

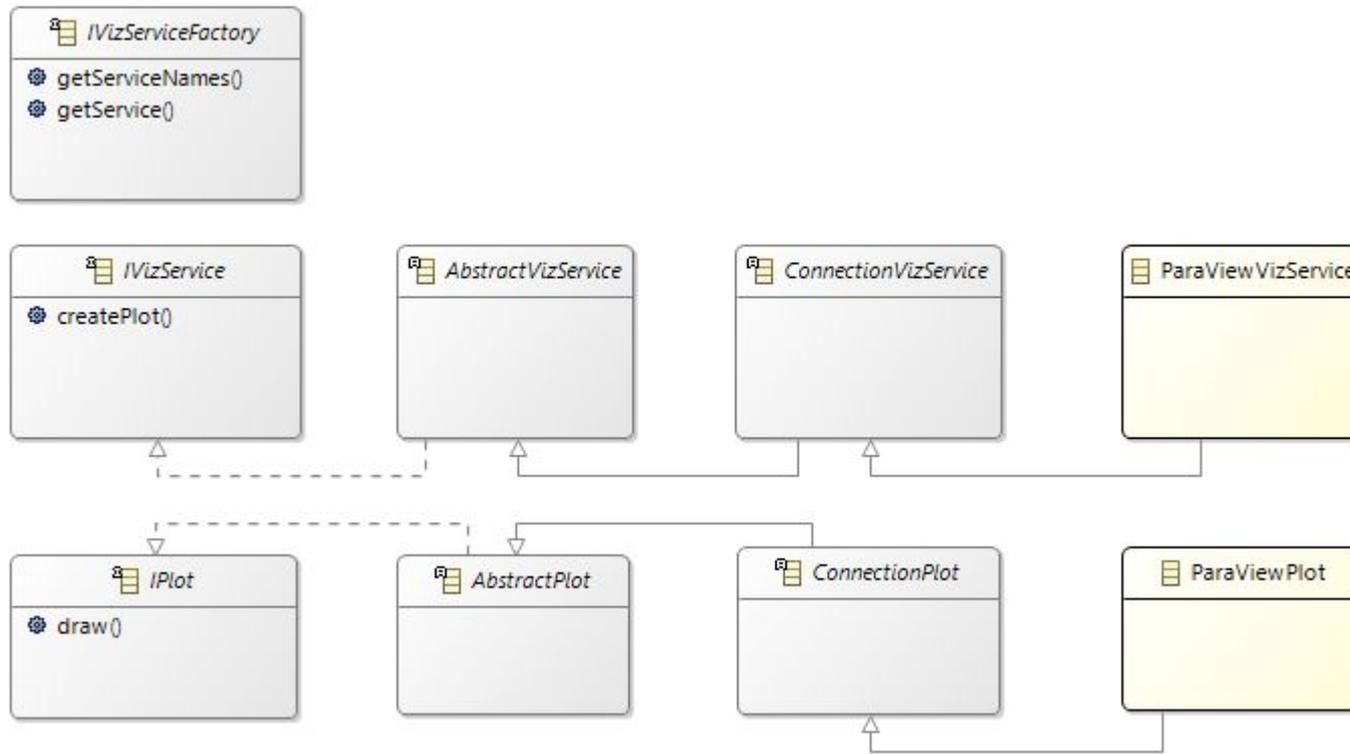

What is EAVP?

- EAVP features a range of services for different kinds of visualization use cases.
- Provides a flexible API for integrating visualizations.
- Native visualizations in Eclipse SWT and embedded JavaFX.
- Third party visualizations.
- Published as a p2 repository to be drawn into RCP applications.

Visualization Service Architecture

- Each type of visualization is implemented as its own OSGi bundle.
- Bundles contain an implementation of IVizService that can draw the visualization to a composite.
- The RCP app can select which visualization capabilities it wants by finding the right IVizService.
- Bundles may also contain extensions to the preferences menu to allow the user to configure the service.

Visualization Service Architecture

Leveraging EAVP Services to Visualize Files in the Workspace

- Visualizing a file is as simple as handing it to the correct service
- Each IVizService provides a list of compatible file types.
- Invoking `createCanvas()` or `createPlot()` returns an `IVizCanvas` or `IPlot`.
- Using `.draw()` will draw it to a composite.

Setting Up Connections to Third Party Software

Connections to local or remote machines are supported.

Local visualization

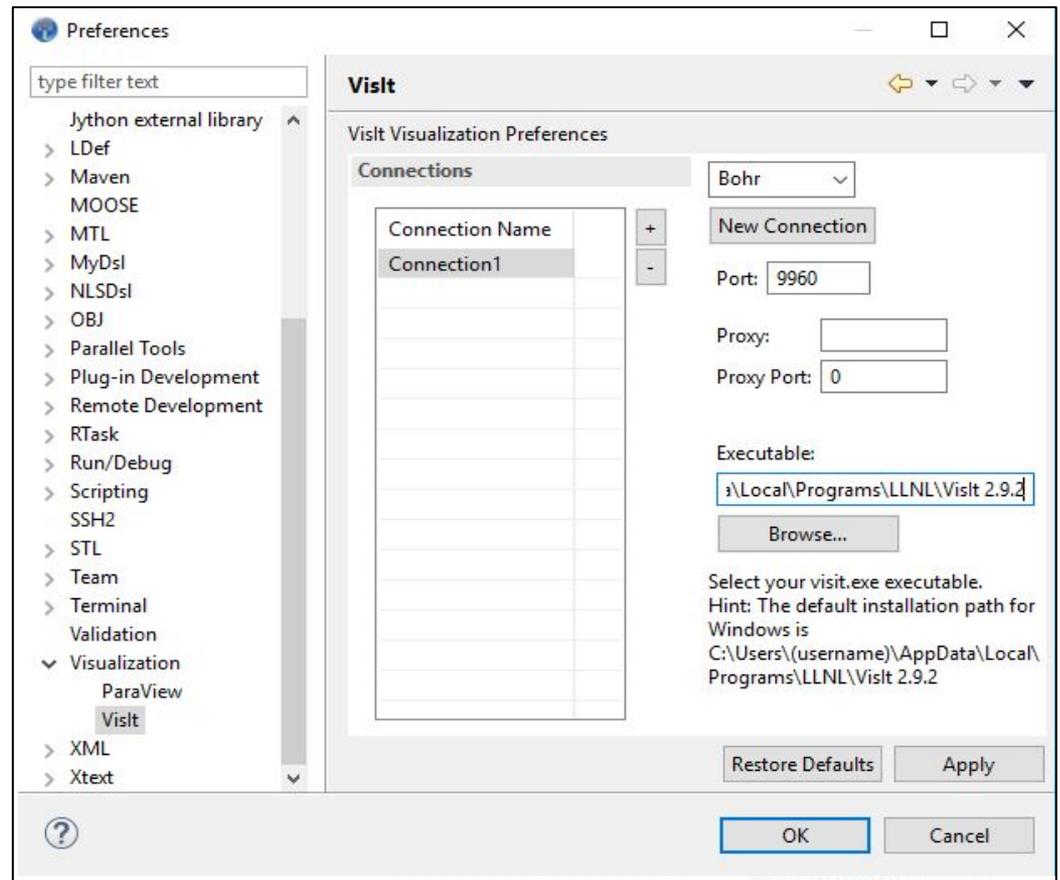

Remote visualization

Setting Up Connections to Third Party Software

- Preference menu contributions configure connection
- Uses the parallel tool platform's connections as a base.
- Can be configured to open connections automatically on startup.

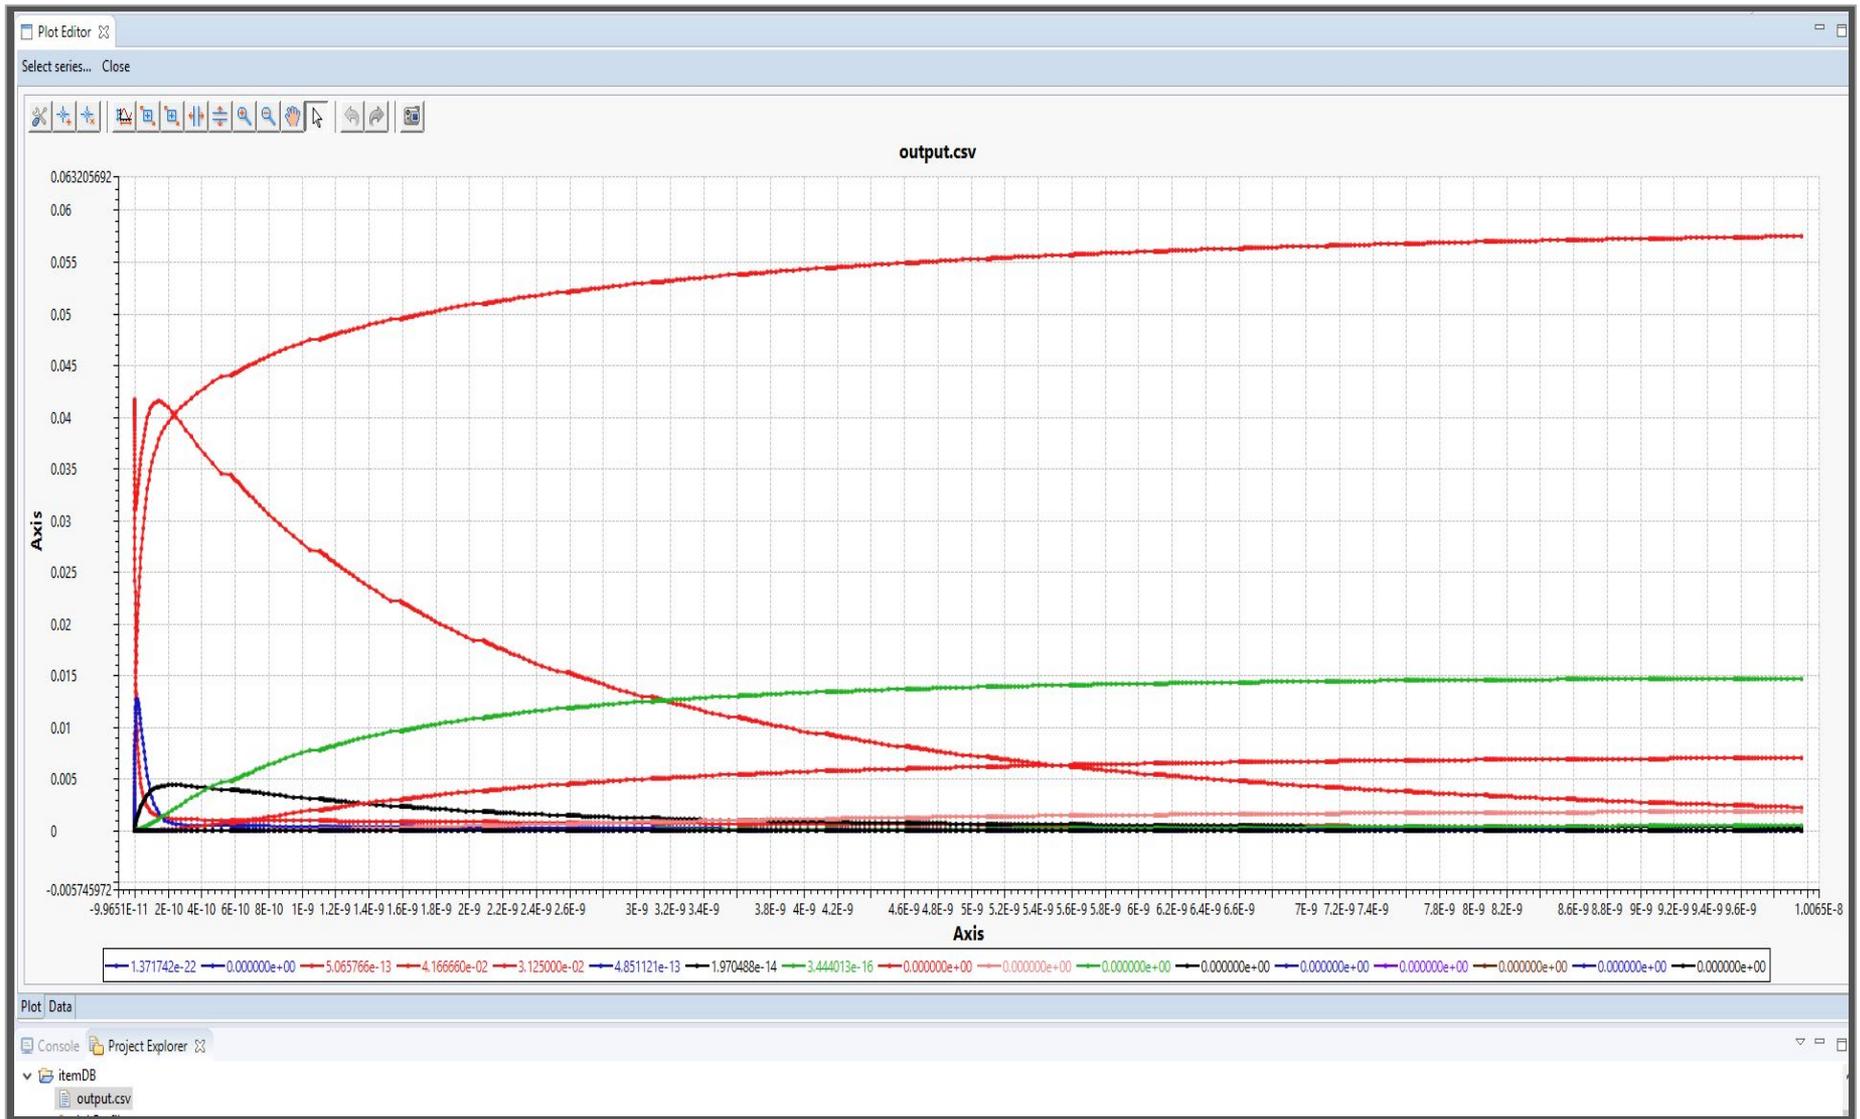

Preferences Menu in Workbench

Examples - 2D Plotting

2D Plotting

- The simplest example of a visualization service is the CSV graph implemented with SWT-XY-Graph.
- The service takes a .csv or .dat file as input.
- Parses the file to try to guess the delimiter.
- Draws a plot containing the file's data to the given composite.
- Has controls for editing how the graph is displayed.
- Also includes the data from the file in a text editor.

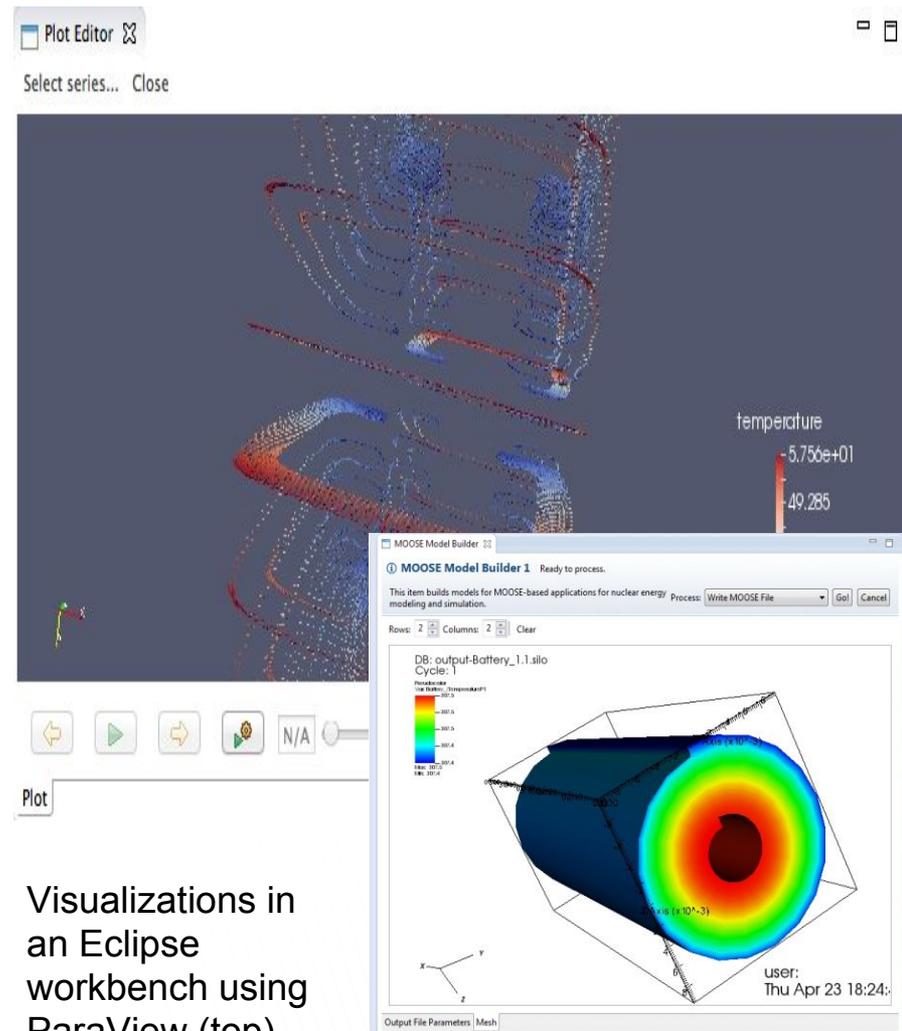

2D Plotting

Examples - VisIt and Paraview

VisIt and ParaView Integration

- VisIt and Paraview are two of the most popular visualization programs for scientific data.
- Open source.
- Scale to visualizing even HPC data.
- Handle a large variety of file types, including .exo, .gen, .nemesis, .silo, .nek5000, and .xyz

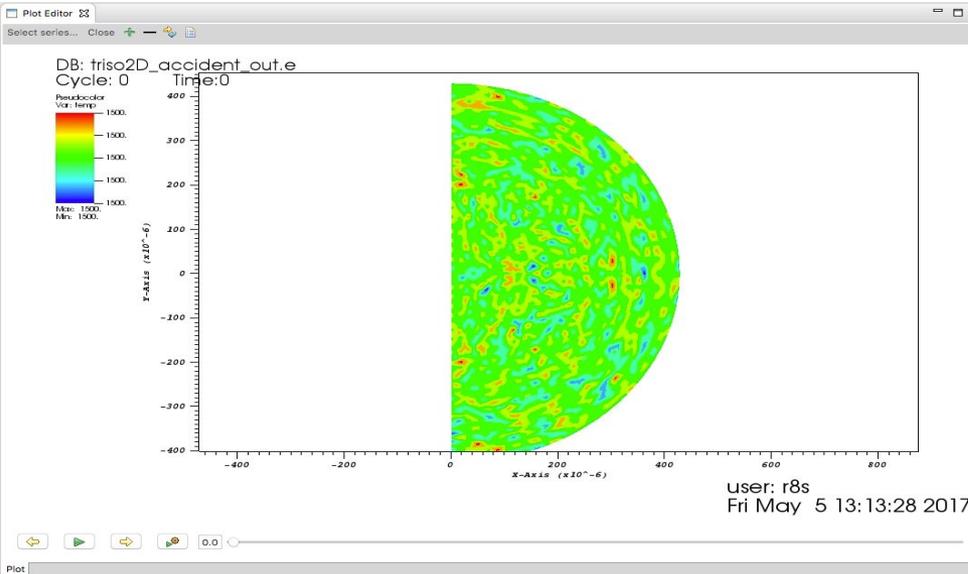

Visualizations in an Eclipse workbench using ParaView (top) and VisIt (right).

VisIt and ParaView Integration

- VisIt/ParaView must be downloaded and installed separately from Eclipse, not necessarily on the same machine.
- The EAVP service allows the user to configure a connection to the third party program.
- When the connection is opened, EAVP will launch VisIt/ParaView in the background.

VisIt and ParaView Integration

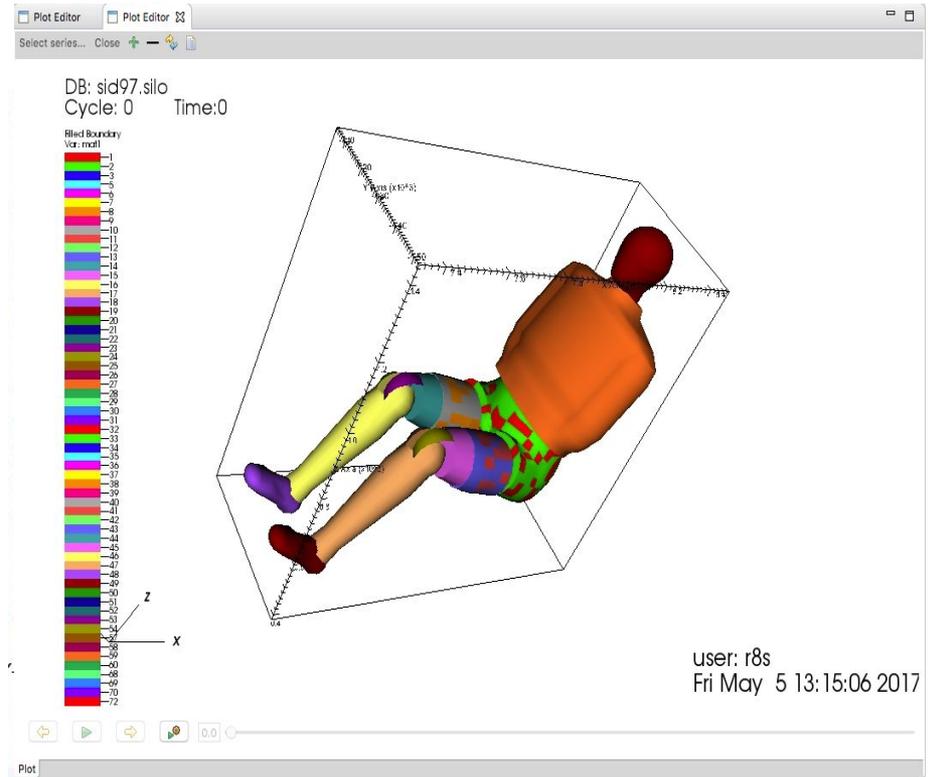

- When EAVP is set to visualize a file, it will pass the file to VisIt/ParaView.
- The visualization program will open the file and create a model as normal. Images are sent back to Eclipse to paint to the screen.

Temperature map for a tristructural-Isotropic fuel pellet, visualized in VisIt.

VisIt and ParaView Integration

- Interacting with the canvas (eg by clicking and dragging) sends commands to program.
- Other functionality (such as setting the model type or exposing Python scripting) done through UI.

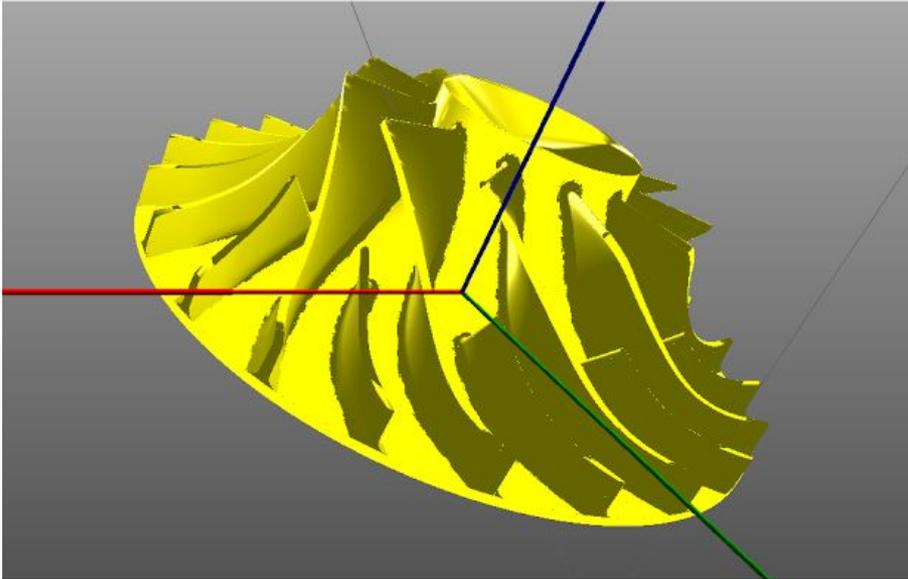

A crash test dummy model in VisIt.

Examples - 3D Modeling in Java FX

3D Modeling with JavaFX

- JavaFX allows for displaying a 3D graphics scene.
 - Shipped as part of the JDK.
 - Lacks potential copyright problems from e.g. LWJGL.
- Intended for casual development without advanced graphics features (eg direct shader support, access to matrix transforms, custom vertex stream configuration, etc.)
- Better suited to real time editing than heavy duty visualizers.

3D Modeling with JavaFX: Technical Concerns

A fluid impeller modeled in the Geometry Editor.

- e(fx)clipse project integrates it with Eclipse.
- A JavaFX scene is embedded directly into a Eclipse SWT composite.
- User events are transparently forwarded to scene.

3D Modeling with JavaFX: Mesh Editor

- Mesh Editor allows for editing of 2D meshes.
- User may create new polygons by clicking.
- Existing meshes can be edited either by mouse or through the properties view.
- Properties may be assigned/edited for polygons/lines/points.
- Currently limited to fluid dynamics boundary conditions

3D Modeling with JavaFX: Mesh Editor

ICE - This editor can construct one or two dimensional meshes. - Eclipse Platform

File Edit Navigate Search Project Run Window Help

Quick Access | Resource ICE Java Git

Geometry Editor.xml Mesh Editor.xml

MeshEditor Item 2 Ready to process.

This editor can construct one or two dimensional meshes. Process:

Mode

Edge 6

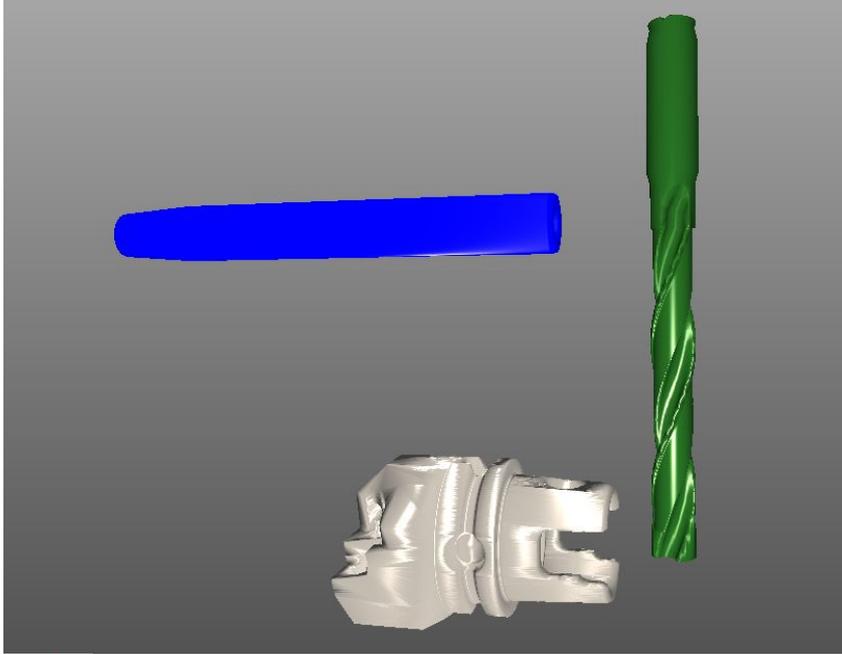

Edge 7 Values:

Edge 8 Thermal Boundary Condition

Transformation View

Size	2.0		
	X	Y	Z
Translate	0.0	0.0	35.0
Rotation	0.0	0.0	0.0
Scale	1.0	1.0	0.1

3D Modeling with JavaFX: Geometry Editor

Shrinker, drill bit, and fastener in the geometry editor

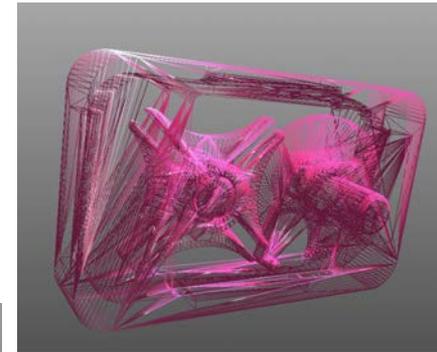

- Geometry Editor is an editor for 3D structures.
- Uses constructive solid geometry.
- Provides basic sample shapes, but main use is importing geometry files.

3D Modeling with JavaFX: Geometry Editor

- Supports a variety of file types (.stl, .obj, .vtk, .mtl, .iges)
- Files are read through Xtext DSLs provided through Eclipse extension points.
- Related data structures for file reading have been moved to the January Eclipse project.

A teapot obj file

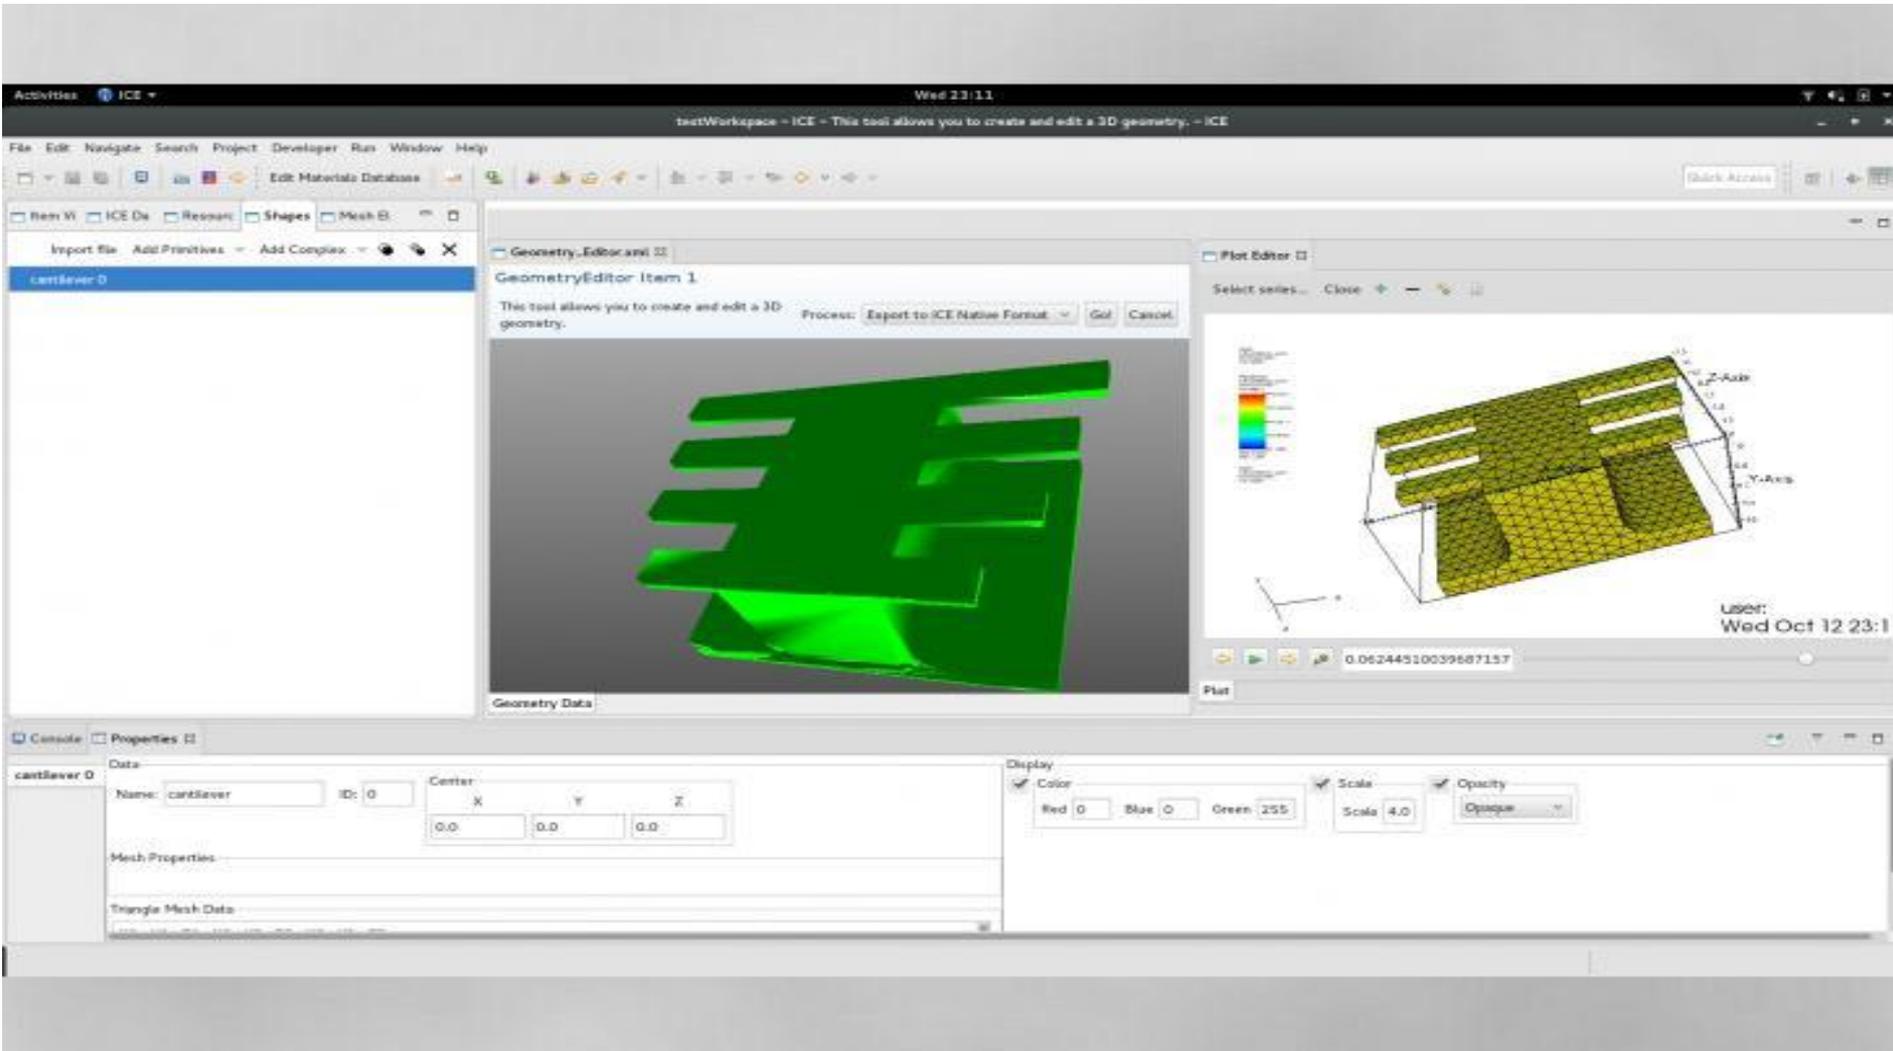

A hard drive stl file

"VTK" spelled out by a vtk file

3D Modeling with JavaFX: Geometry Editor

3D Modeling with JavaFX: Geometry Editor

The screenshot displays the Geometry Editor application. The main window shows a 3D wireframe model of a slot machine. A blue callout box with a white arrow points to the Properties view at the bottom, containing the text: "Data for shapes is kept in properties view." The Properties view is divided into several sections: "Data" (Name: slot_machine, ID: 0, Center X: 0.0, Y: 0.0, Z: 0.0), "Mesh Properties", "Triangle Mesh Data", and "Display" (Color: Red 0, Blue 0, Green 255; Scale: 1.0; Opacity: Wireframe). The left sidebar lists the hierarchy of shapes, including slot_machine 0, 777 0, pivot 0, handle 0, knob 0, readout1 0, readout2 0, readout3 0, coindrop 0, cointrn 0, wood 0, chrome 0, light 0, plate1 0, clear 0, plate3 0, plate2 0, but1top 0, but1base 0, but2top 0, and but2base 0. The top menu bar includes "Import file", "Add Primitives", and "Add Complex". A warning message at the top states "GeometryEditor Item 1 There are unsaved changes on the form." and a "Process" button is set to "Export to ICE Native Format".

Data for shapes is kept in properties view.

Future Developments

- Integration with the Eclipse Advanced Scripting Environment(EASE) to allow interoperability between the visualizations and Python scripting.
- Expand to cover use cases outside of Eclipse RCP, with a focus on working on the web.
 - Vaadin framework
 - Swing
 - JavaFX

More Future Work...

- Offering alternate graphical engine implementations for services.
- In Situ visualization support.
- Full 3D mesh editing and better finite element support.
- Paper under development

Questions?

- Thanks to...
 - Our research sponsors.
 - My colleagues at ORNL who have contributed to EAVP, including Jay Jay Billings, Alex McCaskey, Greg Watson, and Anara Kozhokanova
 - Sandia National Laboratory for collaboration with the Sandia Analysis Workbench(SAW).
 - Chemclipse for providing a SWTChart visualization service.
 - L33t Labs for collaboration on JavaFX Geometry Editor.
